

Matter-Centric Architecture Management

ilmport Content Importer

For WorkSite

Whether you are migrating to WorkSite from a different system (or no DMS at all), or have new volumes of content to process, ilmport is the most powerful tool for importing content into WorkSite, in either automated or on-demand jobs.

Simple importing is fast and easy. Advanced importing is as robust as you need. With powerful workflow capabilities, you can even use data-driven methods to create branching processes that determine where to place content, set metadata, security, and more.

Whether you are importing or converting a large amount of data for a one-time migration, or addressing ongoing needs for importing documents from new attorneys or offsite trial teams, ilmport is the best tool for the job.

Key Features

- Read and write to any number of ODBC databases for structural and document profile data, security, and history.
- Stage up to 15 steps of workflow processing for **each document**, including setting security and converting imported content to encrypted PDF.
- Operates automatically (unattended) or manually (on-demand).
- Full data logging of all operations.
- Recreate all metadata and security values on matter-centric structures, and history records on individual documents.
- Support for differential importing, with version control.

WorkSite Exporter

For WorkSite

Whether dictated by mobile/remote groups, mergers & acquisitions, or employee exit policies, exporting documents and data is fast and easy with WorkSite Exporter. This desktop product is a powerful add-in to DeskSite or FileSite clients that can easily export **everything** in multiple folders or WorkSpaces. In addition, differential updates allow WorkSite Exporter to act only on new or changed content, which allows for rapid and comprehensive updating exports.

Key Features

- Export everything in one or more WorkSpaces or folders — works in non-matter centric systems.
- Preserve, create, or enhance organizational structure of exported content.
- Create comprehensive log files of all content and structures exported, including all metadata, security, and history values.
- Differential capabilities allow for fastest possible export of large WorkSpaces, only exporting new or changed content.
- “Round Trip” Workspace structures and content with ilmport companion. Export then recreate entire WorkSpaces.
- View detailed reports of all files and structures exported, with user-specified data fields.
- “Checkout” allows for native WorkSite “Check In” option.

ilmport's flexibility and power for automated and on-demand importing, and DocAuto's responsiveness, are a winning combination.
